

LTi ELECTRONiCS - a new electronic manufacturing service established in the German market

LTi ELECTRONiCS is the new electronics manufacturing service (EMS), which was founded on 01 April 2009 by the spin-off of LTi DRiVES, a specialist in electric drives and automation technology. So while the company name is new, this new EMS provider has more than 30 years of experience in electronics production, gained in manufacturing electronic components and systems for frequency inverters.

LTi ELECTRONiCS has around 120 employees and continues to produce control and power electronics for the LTi group. The new company is guided by the concept of supplying electronic components from a cost-effective electronics service provider. Many of those who need the components and devices became customers years ago. They all benefit from the major purchasing potential, from the modern machine park and the vast skills of a motivated workforce.

As early as 2006, LTi was manufacturing power and control electronics free of lead, in accordance with the RoHS Directive. The company also produces a variety of products in lead-based processes, for instance for LTi's Mobile Power segment (drives for electric and hybrid vehicles)

LTi ELECTRONiCS' new company building offers ideal conditions for electronics manufacturing over an area of 2,000 m². Services offered range from globally active purchasing, with efficient production technologies and processes that use Siplace lines, ERSA Power Flow wave soldering units, and which are equipped with robotic paint lines and automated test systems. High process quality is the guarantee for good and cost-effective products that are *made in Germany*.

The LTi ELECTRONiCS portfolio is rounded off by electronics development with experienced layout designers, and innovative customer services ranging from product development to individual series production in JiT, JiS or Kanban control circuits.

Visit our website at www.lti-electronics.com for further information.

Let yourself be convinced by our expertise. You too can benefit from our experience in manufacturing electronic components and systems.
