

Press Release 4/2009

## **Mobile Power: 10 years of Hybrid Drives from LTi**

At this year's Hanover trade fair LTi DRIVES GmbH are presenting the theme of "Mobile Power" for the first time. At LTi Mobile Power stands for drives of hybrid and electric vehicles.

At their exhibition stand K09 in Hall 14 the medium-sized company will be presenting a power electronics system developed to satisfy specific customer requirements. For more than 10 years this power electronics system has been used to control the diesel-electric hybrid drive of an industrial truck.

LTi is perfectly equipped for the "hot" topic of hybrid and electric vehicles: the company has its origins in drive and automation technology. LTi's use over many years of LTi drive controllers in the industrial environment has resulted in the company acquiring extensive expertise in the field of high-voltage electronics. Furthermore, LTi's experience with rotor blade adjustments for large wind energy systems can be transferred to the challenging ambient conditions of hybrid and electric drives.

The firm LTi DRIVES GmbH will continue to expand its newly-formed Mobile Power segment and is concentrating mainly on European manufacturers of commercial vehicles, mobile machines and electric vehicles. By the end of 2009, the company plans to achieve double-figure growth in spite of the economic crisis.
